

Universal Telephone Audio

FOR DRIVE-THRU APPLICATIONS

Discover how this new technology can:

Enhance communication

Reduce background noise

Be more efficient and lower cost when compared to multi-console alternatives

Reduce your operational labor costs

Provide greater employee flexibility

Assure users that each call is private

The Bavis Universal Telephone Audio Interface replaces the standard drive-thru console with your existing phone system. When using this interface, each drive-thru lane looks like an incoming or out-going call to the telephone system. The calls can be sent to specific phones including wireless headsets. All of the call handling features of your telephone system are now available for use at the drive-thru. For example, a customer at the drive-thru can be transferred elsewhere for assistance, be made a participant on a conference call, receive informercials, etc.

This interface provides the flexibility to meet your individual needs. If you choose not to use your existing phone system, you can purchase inexpensive over-the-counter telephones and dedicate them to the drive-thru.
